MAYO CLINIC
LABORATORIES

MITsdm

Background and Challenge

Background

Mayo Clinic reference lab conducts 26 million specialized tests from more than 70 countries annually. While the lab provides world-class testing, offering deep contextual knowledge and consultation expertise, the current delivery format is limited to a standard, commodity report.

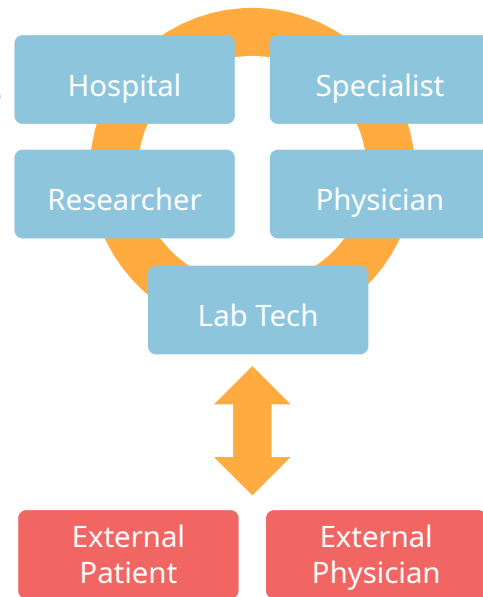

Challenge

Transform the test result reports in order to leverage Mayo's Clinic Model and specialists alongside with AI Agentic technology in order to enable modern interfaces and personalized information to patients and their physicians.

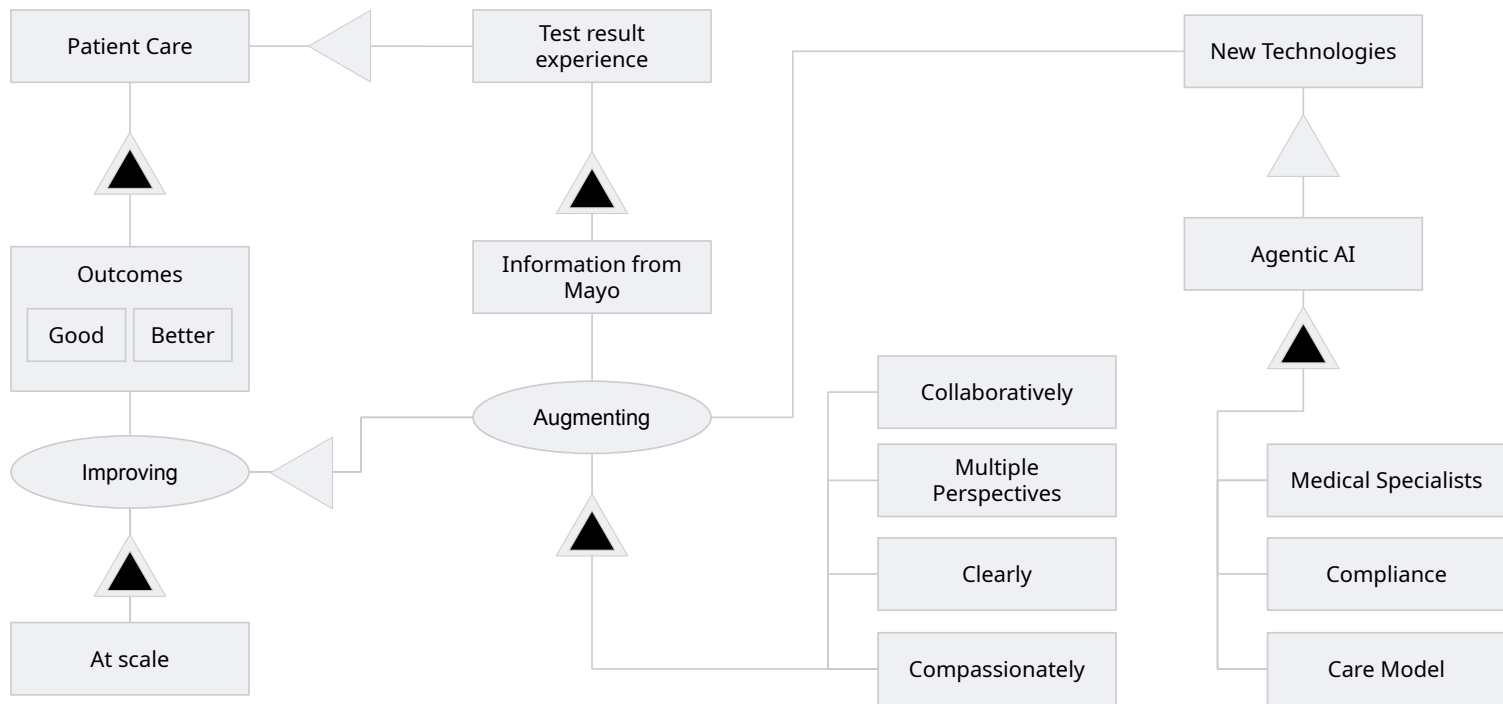

Team Reflection

We're excited to take on this challenge! As a global team from three different countries with different health care systems, we bring a diversity of perspectives to how to improve health care. We all have AI experience in different domains and are excited to expand to a new domain.

System Problem Statement

TO improve external patient care outcomes at scale

BY clearly, compassionately, and collaboratively augmenting the information provided with Mayo test results

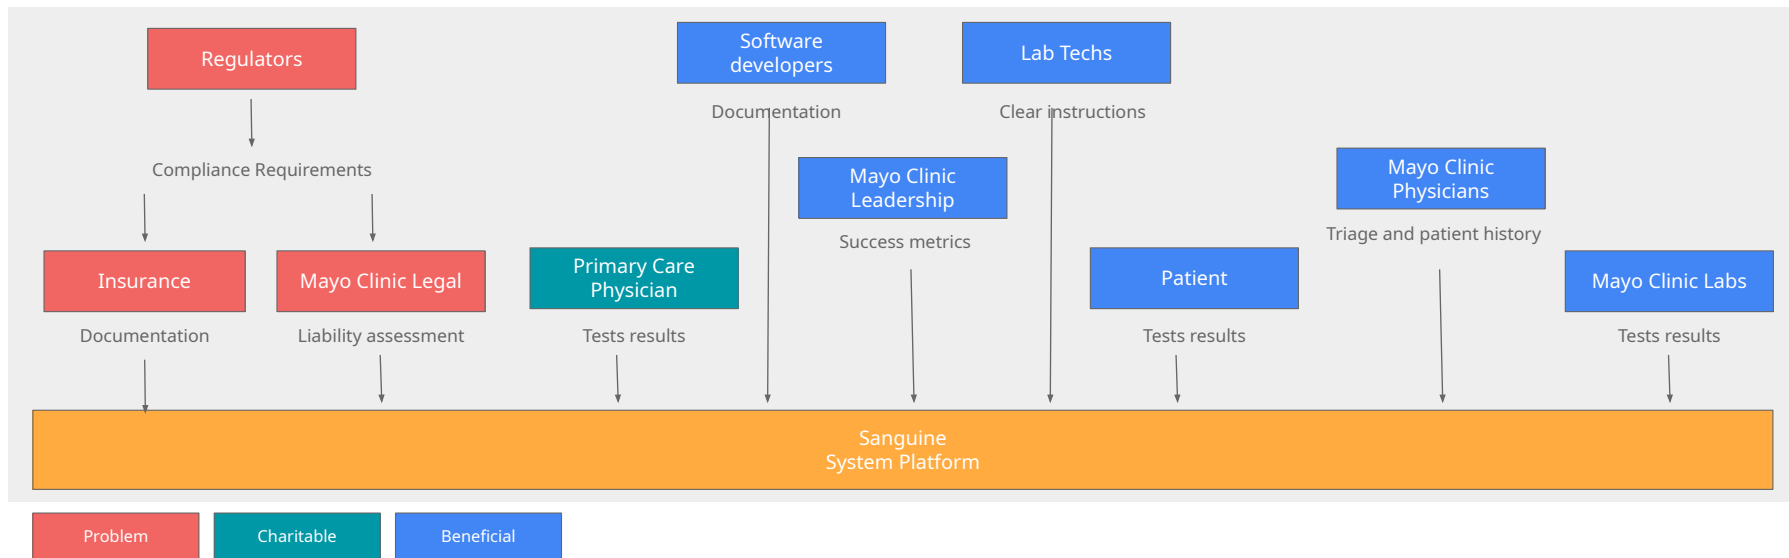

USING multi-specialized AI agents, such as multiple medical specialists

Stakeholder Analysis

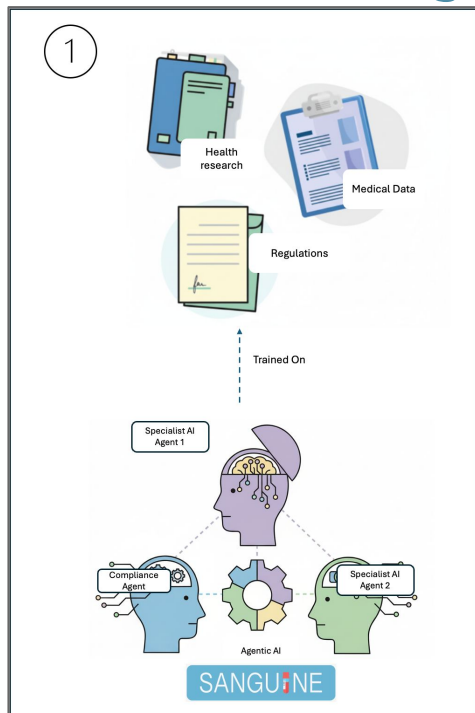

Team Reflection

- Patient trust is earned slowly, lost instantly — Sanguine's tone matters as much as accuracy
- Regulators and Legal are not blockers — they're co-designers of what's possible
- External physicians must see Sanguine as a tool, not a threat
- Mayo's reputation is our leverage and our liability
- We're designing for the scared patient at 2am, not just the informed one at noon
- Architecture flexibility now enables options later

CONOPS and Strategic needs

- 1 Patient care outcomes via improved patient and physician understanding
- 2 Improve Mayo brand perception in result delivery
